EDUCATION

Western University **London, ON, Canada**

Bachelor of Engineering, Software Engineering *04/2025*

- **Courses:** Data Structures and Algorithms, Operating Systems, Database Management, Computer Networking, Cloud Computing, Web Technologies, Machine Learning, Information Security, Artificial Intelligence

TECHNICAL SKILLS

Programming Languages: Python, TypeScript, JavaScript, Java, C#, SQL, HTML/CSS
Frameworks and Libraries: Angular, React, Spring Boot, Flask, Node.js, Express, sklearn, pandas, Selenium, Appium
DevOps and Tools: Docker, Kubernetes, Kafka, Grafana, JFrog, GitHub Actions, Bitrise, Git, Postman
Cloud Platforms and Data: Google Cloud Platform (BigQuery, Firestore, Compute Engine), Amazon Web Services (EC2, S3, Glue, Lambda), Oracle, PostgreSQL, MongoDB

WORK EXPERIENCE

Software Development Engineer in Test **Dearborn, MI, United States**

Ford Motor Company *08/2025 - Present*

- Developed automated test suites with Python, Appium, and Gherkin, automating **15%+** of manual regression test cases for FordPass and Lincoln Way mobile apps, reducing testing time and accelerating release feedback cycles.
- Integrated CI/CD pipelines using GitHub Actions to orchestrate automated test execution, specifically app installation from Bitrise artifacts, device health verification, and environment configuration, eliminating manual setup.
- Engineered a machine learning fallback system by labeling **100+** mobile UI screenshots and training a YOLO-based object detection model as an alternative to resource and accessibility identifiers, reducing test flakiness by **40%**.
- Owned comprehensive manual testing of **60** critical test cases per release across different physical devices and software versions (iOS, Android) capturing detailed artifacts (logs, screenshots) to accelerate defect reproduction and resolution.
- Established quality engineering standards through comprehensive onboarding documentation, system architecture diagrams, and slide decks that aligned product managers, developers, and directors on test strategies and quality goals.

Software Engineering Intern **London, ON, Canada**

J.D. Power *05/2023 - 08/2024*

- Built components for a full stack ETL platform within the Artificial Intelligence Cloud Delivery Unit, the largest internal data analysis tool in the company using Angular, TypeScript, Python, BigQuery, Firestore, and Docker.
- Onboarded analytics platform by building and deploying a scalable Java Spring Boot and React application.
- Resolved migration issues during Angular version 17 to 18 upgrade, specifically runtime errors caused by conflicting ngModel and formControl usage on the same input element, updated legacy template to meet new form standards.
- Designed and implemented a Google BigQuery rollback mechanism that optimized SQL database workflows, reduced system downtime by **35%**, and ensured uninterrupted access to critical data.
- Integrated in-platform support functionality allowing users to submit issues directly to Jira, streamlining cross team communication, accelerating the bug resolution process, and reduced average ticket creation time by **95%**.
- Enhanced application reliability by maintaining comprehensive documentation, prioritizing high impact Jira tickets in Agile sprints, and increasing unit test coverage to over **60%** with Jest, contributing to a **90%** on time release rate.

PROJECTS

London Transit Delays YouTube

- Won 1st place at Western University 2025 Capstone by building a scalable, production transit analytics system with a containerized microservices architecture (MongoDB, Jupyter Notebooks, Node.js ingestion, Grafana dashboards).
- Delivered an end-to-end ETL pipeline for data collection and preprocessing then trained and deployed a Keras Neural Network predicting 15-min delays with less than 5 min mean absolute error.

Stockr GitHub

- Launched a full-stack finance app with real-time trading, portfolio analytics, sector breakdowns, and watchlists.
- Deployed production to Railway, used Docker Compose for local multi-service dev/testing to streamline CI/CD.
- Integrated an OpenAI RAG financial advisor generating market recommendations from personal portfolio data, current market feeds, and Twitter sentiment (Flask/Postgres API, Next.js UI, Firebase Auth).
