EDUCATION

Western University **London, ON**

Bachelor of Engineering, Software Engineering *04/2025*

- **Courses:** Data Structures and Algorithms, Operating Systems, Database Management, Computer Networking, Cloud Computing, Web Technologies, Machine Learning, Information Security, Artificial Intelligence

TECHNICAL SKILLS

Programming Languages: TypeScript, JavaScript, Python, Java, C#, SQL, HTML/CSS
Frameworks and Libraries: Angular, React, Spring Boot, Flask, Node.js, Express, sklearn, pandas, Selenium
DevOps and Tools: Docker, Kubernetes, Grafana, Jenkins, Maven, Bitrise, Git, Postman
Cloud Platforms and Data: Google Cloud Platform (BigQuery, Firestore, Compute Engine), Amazon Web Services (EC2, S3, Glue, Lambda), PostgreSQL, MongoDB, PySpark

WORK EXPERIENCE

Software Automation Engineer **Detroit, MI**

Ford Motor Company *08/2025 - Present*

- Developed automated testing frameworks for FordPass and Lincoln Way mobile apps using Python, Appium, Bitrise, TestFlight and TestRails, reducing manual regression testing hours.
- Strengthened CI/CD pipelines by integrating automated tests, accelerating release cycles and improving reliability.

Software Engineer (Professional Engineering Year) **London, ON**

J.D. Power *05/2023 - 08/2024*

- Built components for a full stack ETL platform within the Artificial Intelligence Cloud Delivery Unit, the largest internal data analysis tool in the company using Angular, TypeScript, Python, BigQuery, Firestore, and Docker.
- Resolved migration issues during Angular version 17 to 18 upgrade, specifically runtime errors caused by conflicting ngModel and formControl usage on the same input element, updated legacy template to meet new form standards.
- Designed and implemented a Google BigQuery rollback mechanism that optimized SQL database workflows, reduced system downtime by **35%**, and ensured uninterrupted access to critical data.
- Integrated in-platform support functionality allowing users to submit issues directly to Jira, streamlining cross team communication, accelerating the bug resolution process, and reduced average ticket creation time by **95%**.
- Enhanced application reliability by maintaining comprehensive documentation, prioritizing high impact Jira tickets in Agile sprints, and increasing unit test coverage to over **60%** with Jest, contributing to a **90%** on time release rate.

Software Development Intern **Draper, UT**

Glendor *05/2022 - 08/2022*

- Contributed to the Protected Health Information (PHI) Sanitizer team by automating the removal of sensitive information from medical data, reducing manual processing time by **95%** while ensuring compliance with privacy regulations.
- Engineered a robust Health Level 7 (HL7) to XML conversion algorithm using Python, incorporating web scraping with BeautifulSoup and Selenium for header extraction to achieve efficient, reliable data transformation across datasets.

PROJECTS

London Transit Delays YouTube

- Won 1st place at Western University 2025 Capstone for building a scalable, production-style transit analytics system.
- Architected a containerized microservices environment with four independent services: MongoDB (storage), Jupyter (preprocessing/ML), Node.js (ingestion), and Grafana (real-time display), coordinated with Docker Compose.
- Delivered an end-to-end ETL pipeline for data collection and preprocessing then trained and deployed a Keras Neural Network predicting 15-min delays with less than 5 min mean absolute error.

Stockr GitHub

- Launched a full-stack finance app with real-time trading, portfolio analytics, sector breakdowns, and watchlists.
- Deployed production to Railway; used Docker Compose for local multi-service dev/testing to streamline CI/CD.
- Integrated an OpenAI RAG financial advisor generating market recommendations from personal portfolio data, current market feeds, and Twitter sentiment (Flask/Postgres API, Next.js UI, Firebase Auth).
